SRE Project Template

## Categorize Responsibilities

### Prometheus and Grafana Screenshots

Provide a screenshot of the Prometheus node\_exporter service running on the EC2 instance. Use the following command to show that the system is running: `sudo systemctl status node_exporter`

```
ubuntu@ip-10-100-10-171:~$ systemctl status node_exporter
● node_exporter.service - Node Exporter
   Loaded: loaded (/etc/systemd/system/node_exporter.service; enabled; vendor preset: enabled)
   Active: active (running) since Mon 2022-02-07 11:37:24 UTC; 3h 4min ago
   Main PID: 24277 (node_exporter)
     Tasks: 7 (limit: 1109)
    CGroup: /system.slice/node_exporter.service
            └─24277 /usr/local/bin/node_exporter

Normal	Flask API healthcheck DOWN	ok	

## Responsibilities

1. The development team wants to release an emergency hotfix to production. Identify two roles of the SRE team who would be involved in this and why.

- *Release Manager* - he will need to identify the risks that the new hotfix poses to the environment and all required steps to achieve deployment
- *Monitoring engineer* - could you specific dashboards to monitor the deployed application

2. The development team is in the early stages of planning to build a new product. Identify two roles of the SRE team that should be invited to the meeting and why.

- *System architect* - one who would be able to advice on the technologies used and infrastructure for the product

- *Team lead - one who can also give its propositions on IT infrastructure, and how the team can be integrated into the project*

3. The emergency hotfix from question 1 was applied and is causing major issues in production. Which SRE role would primarily be involved in mitigating these issues?

- *Release manager - one who controls the deployment and rollback procedures*

# Team Formation and Workflow Identification

## API Monitoring and Notifications

Display the status of an API endpoint: Provide a screenshot of the Grafana dashboard that will show at which point the API is unhealthy (non-200 HTTP code), and when it becomes healthy again (200 HTTP code).

Create a notification channel: Provide a screenshot of the Grafana notification which shows the summary of the issue and when it occurred.

 Grafana v8.3.4 | Yesterday at 8:33 PM

Configure alert rules: Provide a screenshot of the alert rules list in Grafana.

State	Name	Health	Summary
<a href="#">Normal</a>	CPU % is high	ok	
<a href="#">Normal</a>	Flask API healthcheck DOWN	ok	

# Applying the Concepts

Graph 1

4a. Given the above graph, where does it show that the API endpoint is down? Where on the graph does this show that the API is healthy again?

*The outage according to api health check endpoint happens at approximately 15:27. The alert is pending at 15:28 and fired at ~15:35*

4b. If there was no SRE team, how would this outage affect customers?

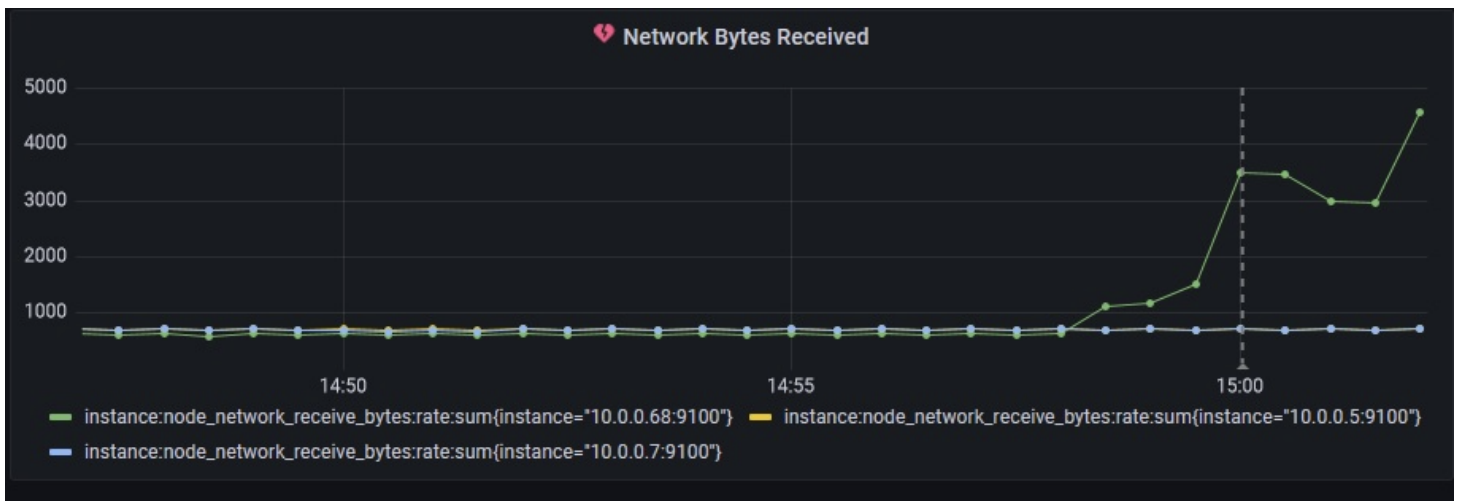

*The whole service would be unavailable(if it is customer facing) or if it is an internally used service, it will degrade or even stop the services that are customer related and rely on this one,*

4c. What could be put in place so that the SRE team could know of the outage before the customer does?

*Firstly a healthcheck monitoring dashboard. One could also monitor application logs for any ERRORS or Exceptions, in order to be aware of any problem as soon as the number of logged Errors increases*

## Graph 2

5a. Given the above graph, which instance had the increase in traffic, and approximately how many bytes did it receive (feel free to round)?

*Instance with IP 10.0.0.68 at port 9100. It received ~3500 bytes at 15:00 and more*

5b. Which team members on the SRE team would be interested in this graph and why?

*Release managers could compare this graph with any recent release and check whether timings of those might be related.*
